MPC-I based automatic block

ABTC-I ELECTRONIC AUTO BLOCK SYSTEM WITH VOICE-FREQUENCY TRACK CIRCUITS

- ABTC-I is designed for train spacing and ensuring train traffic safety at any type of sections, including high-speed ones, with any type of traction on single, double and multitrack railways.
- The system is based on voice-frequency track circuits without insulating joints. Each of adjacent stations is fitted with ABTC-I subset that manages its part of the line.
- Indoor equipment can be housed both in a stationary building or MKM Transportable Module.

APPLICATIONS

- Increasing of line throughput .
- Reduction of capital and running costs.
- Improvement of control efficiency and personnel work environment.

ALSN/ALS-EN
CODING

SCALABLE DEPARTURE
SECTIONS

MOBILE BLOCK
SECTIONS

TRACK CIRCUIT LENGTH
UP TO 800 M

RAILWAY HAUL LENGTH
WITHOUT CONCENTRATION POINTS

UP TO 30 KM

RELIABILITY AND SAFETY

Increased resistance to impulse, commutation and thunderstorm overvoltages

Confirmed **cybersecurity**

FSTEK Certificate for protection against undeclared capabilities and unauthorized access

USER ADVANTAGES

Fully non-relay system.

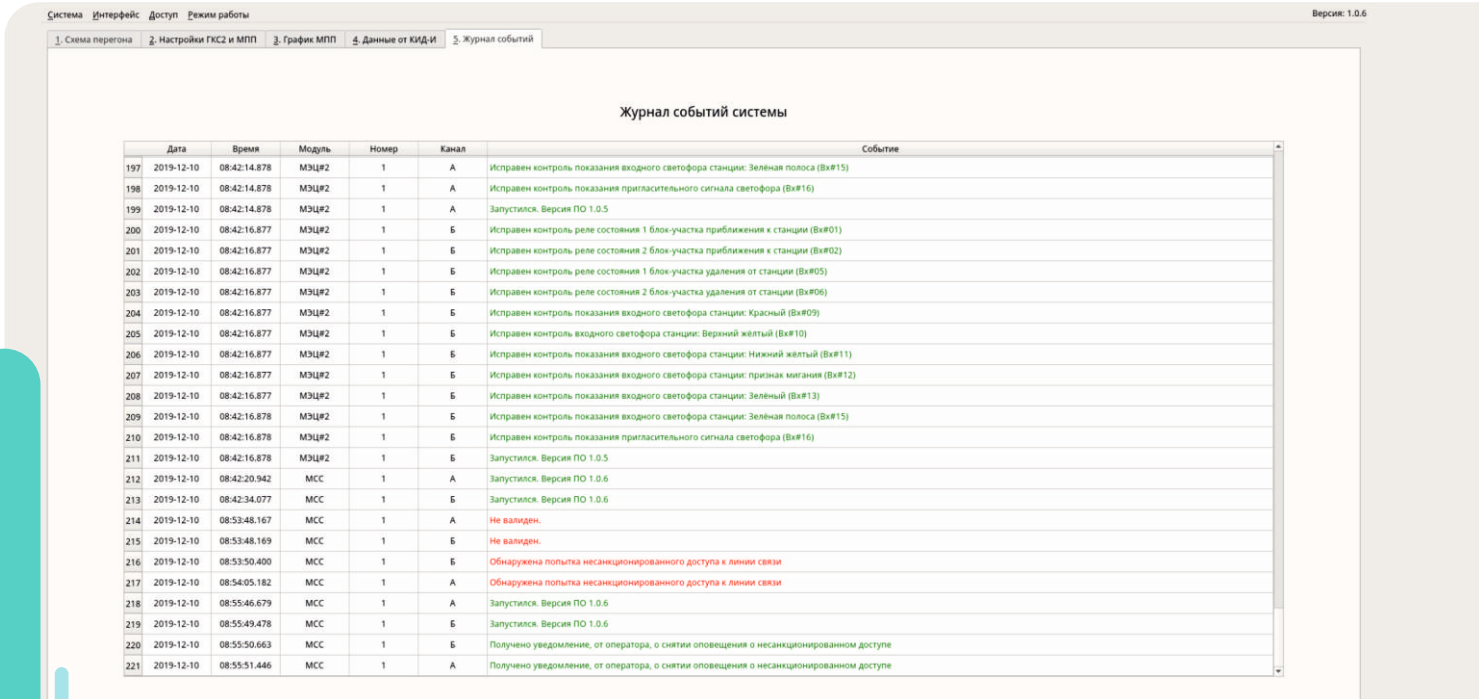
Low maintenance.

In-built diagnostic and monitoring system, continuous event logging.

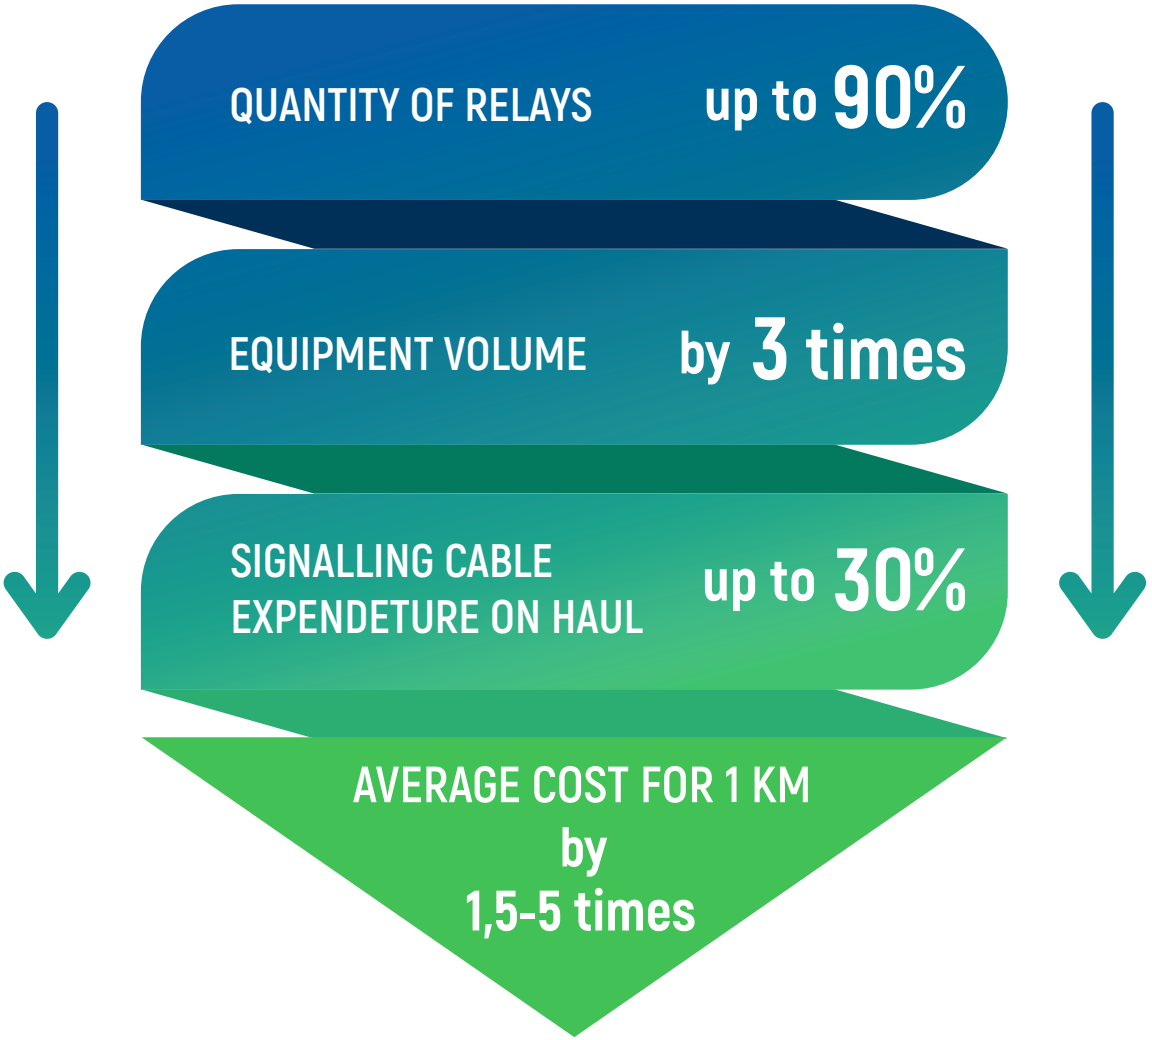
Power efficient equipment.

Integration with MPC-I Interlocking via digital interface.

ABTC-I Diagnostic and monitoring subsystem



REDUCTION OF RUNNING COSTS



*in comparison with other automatic block systems

MPB SEMI-AUTOMATIC BLOCK SYSTEM

- MPB is designed for train spacing on lines with low traffic intensity.
- MPB can transmit data both through physical communication lines and digital systems, such as voice-frequency channel multiplexing equipment, fiber-optic lines and radio channels.
- The system is compact and can be housed in a stationary building on a relay rack or MKM Transportable Module.

APPLICATIONS

- Improvement of train traffic safety on low-traffic lines.
- Increasing of line throughput.
- Reduction of running costs due to decreased amount of relay equipment.
- Improvement of equipment reliability due to automatic switching to redundant communication channel.
- Switching to modern communication means on sections equipped with semiautomatic block systems (transition from aerial communication lines).

IMPLEMENTED ON
107 HAULS

CAPABILITY TO
ARRANGE AUTOMATIC
BLOCK POST

IMPLEMENTED IN
7 COUNTRIES

OPERATING TEMPERATURE
RANGE FROM
-60 UP TO +85°C

RELIABILITY AND SAFETY

Recommended for application on the **Russian Railways network**

Automated communication channel redundancy

Award of the Russian Railways for the best quality of complex technical equipment

USER ADVANTAGES

- In-built diagnostics, event logging.
- Improvement of work environment due to logging of all personnel actions and command automation.
- Operation without adjustments.
- ULIS MPB Lab Set is available for personnel training.
